

Target Audience Pain Points

Frequent Issues & Technical Bugs — UAE Real Estate Marketing Operations

Internal documentation v1.0 · Red Elevators / Mahimul Hoque · 19 September 2026

Part 0 — Scope and How to Use This

Audience covered: UAE real estate brokerages (10–50 agents), top-producing individual agents, developer marketing teams, and the small UAE agencies who serve them — the segments identified as primary targets in the UAE Real Estate Client Acquisition Study.

What this document is: a catalogue of the specific, recurring technical failures inside their marketing and lead operations — what breaks, why it breaks, how to detect it, what it costs them, and how it is fixed.

What it is for:

1. **Discovery calls** — you will already know their problem before they finish describing it.
2. **Teardown production** — every item here is something you can verify from outside, without account access.
3. **Scoping and pricing** — severity and effort are marked per item.
4. **Proof of expertise** — this document *is* the credential. Most competitors cannot name these failures, let alone diagnose them.

How to read an entry: each issue carries a severity, a frequency estimate, the symptom as the client describes it, the technical root cause, a detection method, the business impact, and the fix. Frequency estimates are field judgement calibrated against published industry reporting — treat them as directional, not measured.

Part 1 — The Stack They Actually Run

You cannot diagnose what you cannot picture. A typical Dubai mid-size brokerage runs this, usually assembled by four different people over three years, none of whom are still there.

Layer	Typical tools	Who owns it	Where it breaks
Traffic	Meta Ads, Google Ads, Snapchat, TikTok, Bayut, Property Finder, Dubizzle	Founder or a cheap agency	Account restrictions, Special Ad Category, wasted portal spend
Web	WordPress + Elementor, occasionally Webflow or a custom Next.js build	A freelance developer, long gone	Speed, mobile forms, no tracking, broken redirects
Tagging	GTM, GA4, Meta Pixel, Meta CAPI, Google Ads conversion tags	Nobody	Duplicate containers, null events, no deduplication
Capture	Meta lead forms, site forms, click-to-WhatsApp, portal enquiries, phone calls	Split across three vendors	Leads landing nowhere, no source attached
Routing	WhatsApp Business App or API, shared inbox, email forwarding	Sales manager	No ownership, no SLA, no round-robin
CRM	Property Finder CRM, PropSpace, Bitrix24, LeadRat, HubSpot, GoHighLevel, or a spreadsheet	Sales manager	No source field, no stages, no feedback to ad platforms
Compliance	Trakheesi (DLD, Dubai), Madhmoun via DARI (ADREC, Abu Dhabi)	Listing admin or PRO	Missing permit numbers, mid-flight takedowns

The structural problem: there is no owner of the seam between layers. Every failure in Part 2 lives in a seam.

Part 2 — The Pain Point Catalogue

Category A — Attribution & Tracking

A1 · The Click-to-WhatsApp black hole

Severity: Critical · Frequency: ~9 in 10 accounts

What they say: "Meta says we got 400 conversations. Sales says they got maybe 60 real people. I can't tell which ads actually work."

Root cause. When a user taps a Click-to-WhatsApp ad and sends the first message, Meta injects a `ctwa_clid` click identifier into the webhook payload. That identifier is the only bridge between the ad and the conversation. Almost nobody captures it. Without it there is no path back: the conversation happens inside WhatsApp, the sale closes on a call, and the ad platform never learns which creative produced money. A CAPI event sent *without* `ctwa_clid` is accepted by Meta but never associated with the originating ad — so it looks like it is working while teaching the algorithm nothing.

Compounding factors: CTWA passes no UTM parameters into a landing page, because there is no landing page. Organic inbound messages — someone who found the number on Bayut or a signboard — arrive with no referral data at all and are indistinguishable from paid ones in a shared inbox.

How to detect. Ask one question: *"When a WhatsApp lead closes, can you tell me which ad they came from?"* If the answer involves asking the agent to remember, the bridge does not exist. Technically: check whether the WhatsApp Business API webhook is even connected, and whether any CAPI event carries the click id.

Impact. Meta optimises toward "conversations started" — the cheapest possible tap, not the most valuable buyer. CPL looks excellent and deteriorates week over week as the algorithm buys progressively worse conversations. This is the single largest source of invisible waste in this market.

Fix. WhatsApp Business API (not the App) → capture `ctwa_clid` from the inbound webhook → store it against the lead in the CRM → fire qualified-lead and viewing-booked events back through CAPI carrying that id. **This is your flagship capability and your strongest existing proof point.**

A2 · Pixel and CAPI double-counting

Severity: High · Frequency: very common wherever CAPI has been "installed"

What they say: "Our conversions doubled overnight but sales didn't change."

Root cause. Deduplication depends on the browser event and the server event sharing an identical `event_id` and `event_name`. It fails when:

- the server generates its own id, or sends none at all;
- the id variable is null at fire time, so the handshake never happens;
- separators or casing differ between the two sources;

- CAPI events are batched nightly and land outside the ~48-hour deduplication window;
- the domain is not verified in Business Manager, which quietly limits how much server data Meta will process.

How to detect. Events Manager → the event's deduplication rate. A healthy dual setup shows a high rate; a low one means Meta is counting two conversions for one human. Also check Event Match Quality — real estate accounts routinely sit in the low range because only an unhashed email is sent.

Impact. Every reported metric is inflated. Budget decisions, agent commissions and client reporting all run on a number that is roughly double reality.

Fix. Single source of truth for `event_id` generated in GTM, passed to both paths; send CAPI within minutes, not nightly; verify the domain; enrich the payload with phone, email, `fbc`, `fbp`, city and country to lift match quality.

A3 · GA4 installed, GA4 meaningless

Severity: High · Frequency: near universal

What they say: "We have Google Analytics." (They do. It tells them nothing.)

Root cause — a cluster, and you will usually find several at once:

- No conversion events marked at all, or "Contact" marked as a conversion when it is really a button click with no follow-through.
- Internal traffic not excluded, so agents browsing their own listings inflate every engagement metric.
- No cross-domain measurement between the main site, a campaign microsite, and a booking or calendar subdomain — one visitor becomes three, and the referrer is self-referral.
- Currency left at USD while the business prices in AED, so every value figure is silently wrong.
- Reporting timezone left on a US default, so "yesterday" in GA4 is not yesterday in Dubai and daily reports never reconcile with Ads Manager.
- Two GTM containers on the page from two different vendors, firing the same tags twice.

How to detect. Realtime + DebugView on a live session from your own phone; check the property's currency and timezone settings; view source for duplicate `GTM-` container ids.

Impact. The client believes they have measurement. They are making budget decisions from a broken instrument, which is worse than having none.

Fix. Rebuild the measurement plan from the business question backwards: what is a qualified lead, what is a viewing, what is a deal — then instrument only those.

A4 · Consent Mode v2 silently deleting the overseas investor audience

Severity: High · Frequency: common, almost always undiagnosed

What they say: "Our UK traffic just disappeared from Analytics in the middle of last year."

Root cause. UAE brokerages sell heavily to European buyers, which means a material share of their traffic is EEA and UK. Consent Mode v2 has been mandatory since March 2024, and from **21**

July 2025 Google began switching off advertising features — remarketing, conversion tracking, demographic reporting — for accounts not sending consent signals for that traffic. Most UAE sites either have no consent banner, or have one that displays but never communicates a consent state to the Google tags. Reported GA4 losses in the worst cases run to **90-95%** of that traffic segment.

The client experiences this as "Analytics is broken" or "European ads stopped working" and blames the market.

How to detect. Load the site through a European IP and watch the tag behaviour; check whether a CMP is wired into GTM's consent initialisation, or merely dropped in as a cosmetic banner.

Impact. EEA and UK remarketing lists stop filling. Conversion attribution for the highest-value overseas buyer segment goes dark. Spend continues regardless.

Fix. A genuine CMP integrated with GTM consent initialisation, all four signals, with conversion modelling and server-side tagging to recover part of the loss. *Confirm the client's actual EEA traffic share before selling this — for a purely GCC-facing brokerage it is not a priority.*

A5 · No feedback loop from CRM to ad platform

Severity: Critical · Frequency: ~9 in 10

What they say: "We get loads of leads. They're just rubbish."

Root cause. Lead stages — contacted, qualified, viewing booked, offer made, closed — live in the CRM and never travel back to Meta or Google. The algorithms therefore optimise for the *cheapest lead*, since that is the only outcome they can observe, and have no way to learn what a good one looks like.

How to detect. Google Ads → Conversions: is there any imported offline conversion action? Meta → is any CAPI event firing from the CRM rather than the website? In most accounts, no.

Impact. This is the mechanism behind "leads are rubbish." The client blames creative, targeting, or the market. The actual cause is that they never told the machine what a good lead is, so it kept buying bad ones — correctly, by its own objective.

Fix. Offline conversion import to Google Ads and CAPI lead-stage events to Meta, keyed on `gclid`, `fbclid`, `ctwa_clid` or hashed phone. **This is the highest-leverage single fix you can sell in this market**, and it converts "leads are rubbish" from a complaint into a solvable engineering problem.

A6 · Attribution window shorter than the sales cycle

Severity: Medium · Frequency: universal, rarely noticed

Root cause. Meta's default reporting is 7-day click. An off-plan purchase decision — especially from an overseas investor — routinely runs 30 to 120 days across WhatsApp, a site visit and a payment plan negotiation. Every deal that closes outside the window is invisible to the platform that produced it.

Impact. Consistent, structural under-reporting of exactly the campaigns that produce real money. Brands kill top-of-funnel campaigns that were working.

Fix. Report on a cohort basis — leads created in month N, deals closed by month N+3 — rather than on the platform's default window. Sell this as a reporting layer, not a tracking fix.

Category B — Lead Capture & Routing

B1 · Lead forms that go nowhere

Severity: Critical · Frequency: common

What they say: "Someone downloads the CSV every couple of days."

Root cause. Meta instant forms hold leads inside the platform until something pulls them out. Leads Access permissions are not granted, no CRM webhook exists, or the integration silently expired when a page token was rotated or an admin left the company. The fallback becomes a manual CSV export — often days late.

How to detect. Ask when the last lead reached the CRM and compare it to the last lead in Ads Manager. A gap of more than minutes means there is no live integration.

Impact. In a market where the same buyer enquires with several agencies simultaneously and qualification odds drop roughly tenfold after the first hour, a two-day-old lead is not a lead. The client is paying full price for leads that are dead on arrival.

Fix. Direct webhook into the CRM, plus a monitoring alert when no lead arrives for N hours — integrations fail silently and nobody notices for weeks.

B2 · Phone number format chaos

Severity: High · Frequency: near universal · Effort: low — excellent quick win

Root cause. The same buyer is stored as +971501234567, 00971501234567, 0501234567, 971 50 123 4567 and 050-123-4567 across portals, lead forms and manual entry. Two consequences:

1. **CRM deduplication fails** — the same person becomes four records, gets contacted by three agents, and the pipeline count is fiction.
2. **CAPI and offline-conversion matching fails** — Meta and Google require E.164 normalisation before hashing. A wrongly formatted number hashes to a value that matches nothing, so match quality collapses and the conversion never attributes.

How to detect. Export 200 CRM rows and count distinct formats. It is always more than three.

Impact. Inflated pipeline, duplicated agent effort, embarrassing double-contact of the same buyer, and silently degraded ad optimisation.

Fix. Normalise to E.164 at every entry point, dedupe historically, hash correctly before transmission. Cheap to do, visibly valuable, and an ideal first deliverable in a Tier 1 engagement.

B3 · Duplicate leads across portals and paid social

Severity: High · Frequency: universal

Root cause. Dubai listing rules permit multiple brokers to market the same property, and serious buyers enquire on several listings at once. The same person therefore arrives as a Bayut enquiry, a Property Finder enquiry, a Meta lead form and a WhatsApp message — four records, one buyer, no shared key.

Impact. Every channel's reported performance is overstated. Agents waste hours on leads a colleague already burned. Cost-per-lead comparisons between portals and paid social are meaningless.

Fix. A deduplication key (normalised phone, then email) applied across all sources on ingestion, with a "first touch source" field preserved so channel credit survives the merge.

B4 · Speed-to-lead collapse

Severity: Critical · Frequency: very common

What they say: "Our agents are on it straight away." (They are not.)

Root cause. Leads land in a shared inbox or a WhatsApp group with no assigned owner, no round-robin, no escalation, and no coverage plan for evenings or the weekend. Industry reporting is consistent: contact within the first few minutes multiplies conversion several-fold, and portal leads are delivered to multiple agencies simultaneously, so the first responder takes most competitive enquiries.

How to detect. Submit a test enquiry yourself, at 9pm on a weekend, from a real number. Time the response. This single test produces the most persuasive slide in any teardown you will ever send.

Impact. The brokerage pays market rate for leads and then loses them to whoever replied first. No amount of media buying fixes it.

Fix. Round-robin assignment with an SLA timer, instant auto-acknowledgement on WhatsApp, escalation when unclaimed, and a response-time report by agent. Partly an ops fix rather than a marketing one — say so, and charge for the diagnosis rather than pretending ads will solve it.

B5 · WhatsApp Business App where the API is required

Severity: High · Frequency: very common in sub-30-agent brokerages

Root cause. The free WhatsApp Business App is tied to one device and a handful of linked sessions. It exposes no webhook, so `ctwa_clid` cannot be captured, no CRM sync is possible, and conversations are trapped on a phone owned by whoever is holding it. Teams that have moved to the API then hit a second tier of problems: message templates rejected for promotional language, and the 24-hour customer service window expiring so re-engagement requires an approved template nobody has prepared.

Impact. Attribution is impossible by construction (see A1). Conversation history walks out of the door when an agent resigns (see E3).

Fix. Migrate to WhatsApp Business API through a BSP, with pre-approved templates for the common re-engagement moments and full conversation logging into the CRM.

Category C — Ad Platform & Account

C1 · Special Ad Category triggered by diaspora targeting

Severity: Medium-High · Frequency: common in accounts targeting overseas buyers

Root cause. Meta enforces housing-related Special Ad Category restrictions for audiences in the **US, Canada and parts of Europe**. A campaign aimed purely at UAE residents generally sits outside it. The moment the account remarkets to investors physically located in the UK or EU, targeting silently narrows: age locks to 18-65+, exclusions disappear, and many interest options become unavailable.

Impact. CPL jumps on the highest-value audience, and the team blames creative fatigue. Nobody connects it to the geography change made three weeks earlier.

Fix. Separate campaign structures by geography, with explicit acknowledgement of category restrictions, and lean on lookalikes and broad targeting where interests are unavailable.

C2 · Account restrictions and disablement

Severity: Critical when it happens · Frequency: episodic but high-impact

Root cause. Several, all common in this sector:

- **Payment failures.** A declined card, an expired method, or a bank flagging a large international transaction — frequent for UAE entities paying in USD — reads to Meta's automation as fraud.
- **Sector verification.** Vendor reporting indicates Meta expanded enhanced verification requirements in early 2026 to cover professional services, financial services and **real estate** among others. *Verify current requirements directly with Meta before advising a client.*
- **Cross-account contamination.** One violation inside a Business Manager can restrict every ad account in that portfolio — a serious exposure for agencies running many client accounts under a single BM.

Impact. Spend stops dead, often on the day a launch goes live. Recovery takes days and depends on an admin filing the appeal.

Fix. Preventive hygiene: verified domain and business, backup payment method, each client in its own Business Manager with partner access rather than shared logins, and named admins who can actually file an appeal. This is unglamorous and clients pay for it readily once burned.

C3 · Creative rejections and mid-flight takedowns

Severity: High · Frequency: constant in this vertical

Root cause. Two independent gates. Meta and Google reject claims like guaranteed ROI, guaranteed residency outcomes, or misleading price framing. Separately, Dubai requires a valid **Trakheesi permit number** on every property advertisement, with the **Madmoun QR code** issued alongside it — with no exemption for social or informal formats (see F1).

Impact. Ads are pulled mid-flight, budget delivery collapses, and — the part nobody accounts for — the learning phase resets. The client sees a CPL spike and blames the media buyer.

Fix. A pre-flight creative QA checklist covering both platform policy and local permit requirements, applied before anything goes live.

C4 · The learning phase that never exits

Severity: Medium · Frequency: very common in self-managed accounts

Root cause. Too many ad sets splitting a small budget, weekly creative swaps that restart learning, and optimisation toward an event that fires too rarely to generate signal. Structurally guaranteed in an account spending AED 15,000 across nine ad sets.

Impact. Permanently unstable CPL, and no campaign ever accumulates enough data to be judged. The account is in perpetual "testing" without ever concluding a test.

Fix. Consolidate ad sets, optimise for an event with sufficient weekly volume, and hold creative stable long enough for a decision.

C5 · Lead forms optimised for volume, delivering junk

Severity: High · Frequency: very common

Root cause. Instant forms with pre-filled fields, no qualification questions, no higher-intent setting, and a generic incentive ("download the brochure"). The form is easy, so it fills — with people who will never transact. Combined with A5, the algorithm then actively seeks more of them.

Impact. Agents lose faith in marketing entirely. The most damaging second-order effect in the whole catalogue: once sales stops working the leads, no measurement fix will show results.

Fix. Qualification questions (budget band, timeline, purpose of purchase), the higher-intent form setting, a real incentive such as a payment-plan breakdown, and — critically — the A5 feedback loop so the platform learns what qualified means.

Category D — Website & Landing Page

D1 · Hero image LCP failure

Severity: High · Frequency: very common

Root cause. On a property page the Largest Contentful Paint element is almost always the hero photograph or render — routinely uncompressed and multiple megabytes. Google's "good" LCP threshold was tightened to **2.0 seconds**, with 2.0–2.5s now "needs improvement". Real estate hero images regularly land at four seconds or worse on mobile data.

Impact. Paid traffic bounces before the page paints. The client is buying clicks for a page a meaningful share of visitors never see. Organic visibility suffers in parallel.

Fix. WebP or AVIF conversion, responsive sizing, preload the hero, lazy-load the gallery. Image compression alone is reported to cut LCP by 30–60% on image-heavy pages — a fast, demonstrable win.

D2 · Mobile form friction

Severity: High · Frequency: very common

Root cause. Eight fields where three would do, no country-code default on the phone input, a dropdown that opens off-screen, a submit button below an intrusive sticky bar, no `autocomplete` or `inputmode` attributes, and validation errors that clear the whole form.

How to detect. Microsoft Clarity — rage clicks on the submit button, dead clicks on a non-interactive element, and scroll depth dying above the form. **This is precisely the analysis already delivered on the Godrej Properties landing pages; the method transfers unchanged.**

Impact. Traffic arrives, engages, and cannot complete. Every CPL figure in the account is inflated by a fixable UX defect.

Fix. Reduce to three fields, default the country code to +971 with international support, correct input modes, inline validation that preserves entries, and a thumb-reachable submit.

D3 · No tracking on the page that matters

Severity: Critical · Frequency: common

Root cause. The container is on the homepage but not on the campaign landing page. Or it is on both, twice. Or the thank-you page redirect fires before the tag does, so the conversion is never recorded. Or the WhatsApp button is an `<a href>` with no event listener at all.

How to detect. Load the live ad destination — not the homepage — with Tag Assistant. This takes four minutes and produces the most common finding in any teardown.

Impact. Zero recorded conversions on a campaign that is converting, or conversions credited to the wrong page. **Already proven in your own work: fixing exactly this on a real estate landing page produced a +13% CVR improvement.**

Fix. Container audit, single source of truth, event-fire verification before redirect, explicit listeners on every outbound WhatsApp and call link.

D4 · Broken funnel between page and endpoint

Severity: High · Frequency: common

Root cause. The landing page hands off to WhatsApp, a Calendly, or a third-party booking tool on another domain without cross-domain linking or parameter forwarding. The `gclid`, `fbclid` and UTM values are dropped at the boundary, so the session restarts as direct traffic.

Impact. The final step of the funnel — the one that matters — is unattributable. Paid campaigns appear to produce enquiries that "came from nowhere".

Fix. Cross-domain configuration, parameter forwarding into the booking tool and into WhatsApp pre-filled message text, with the identifier persisted server-side.

Category E — CRM & Sales Operations

E1 · The CRM as a graveyard

Severity: Critical · Frequency: very common

Root cause. No mandatory source field, manual entry that agents skip under pressure, and top performers who keep their best leads in personal WhatsApp because they do not trust management with them. The same buyer simultaneously exists as a portal enquiry, a WhatsApp thread, a spreadsheet row and a half-filled CRM record.

Impact. Channel attribution is impossible regardless of how good the tracking is. You can measure perfectly up to the CRM boundary and still be unable to answer "which channel produced revenue".

Fix. Automated source capture at ingestion so no human has to type it, mandatory stage fields, and a genuine reason for agents to use the system — usually speed-to-lead tooling that makes their job easier, not reporting that makes it harder.

E2 · No lead stage taxonomy

Severity: High · Frequency: very common

Root cause. Stages are "New" and "Closed", with everything else living in a free-text notes field. There is no agreed definition of "qualified".

Impact. Cost per qualified lead cannot be computed, so CPL remains the operating metric — and CPL rewards the cheapest, worst traffic. It also blocks A5 entirely: there is no stage to send back.

Fix. Define five stages with written criteria, agreed jointly by sales and marketing. Unglamorous, and the prerequisite for everything valuable downstream.

E3 · Data loss on agent churn

Severity: High · Frequency: structural to the industry

Root cause. Agent turnover in Dubai brokerages is high. When conversations live on a personal device and leads live in a personal WhatsApp, the pipeline leaves with the agent — along with the marketing spend that produced it.

Impact. The brokerage repeatedly pays to reacquire buyers it already owned.

Fix. WhatsApp API with central conversation logging, CRM ownership of the record rather than the individual, and structured reassignment on exit. Pair this with a database reactivation campaign over dormant leads — **your RFM segmentation work maps directly onto this**, and it monetises spend the client has already made, which is an unusually easy sale.

E4 · Platform and agency lock-in

Severity: Medium-High · Frequency: common where an agency is incumbent

Root cause. The incumbent agency owns the ad account, the pixel, the domain, the CRM instance, and often the phone number. All-in-one platforms concentrate this further: leave the platform and the automations, history and number mapping do not come with you.

Impact. The client cannot leave without losing their historical data and their pixel learning. They often do not realise this until they try.

Fix. An ownership audit — who holds the ad account, the pixel, the domain registrar, the CRM contract, the WhatsApp number — with migration to client-owned assets and partner access for vendors. **This is already identified as one of your positioning angles; it is also a legitimate first-meeting talking point that immediately differentiates you from the incumbent.**

Category F — Regulatory Compliance

F1 · Missing Trakheesi permit number or QR code

Severity: Critical · Frequency: common, especially on social

Root cause. Every property advertisement in Dubai must carry a valid Trakheesi permit number issued by the Dubai Land Department, and since 24 April 2023 the accompanying **Madmoun QR code**. There is no exemption for social media or informal formats. Reported penalties start at **AED 50,000** for a first offence, with licence review on repetition. The permit is inexpensive — approximately AED 1,000 plus AED 20 in fees, issued in about one working day — so non-compliance is almost always a process failure, not a cost decision.

How to detect. Open the brokerage's Meta Ad Library and look for permit numbers on property creatives. Missing numbers are visible from outside the account, with no access required — which makes this one of the strongest cold-outreach observations available to you.

Impact. Ads and listings pulled mid-flight, budget delivery collapsing, learning phase resets, and direct financial and licensing exposure.

Fix. Permit number and QR baked into the creative template, a pre-flight QA gate, and a permit register mapping each live ad to its permit. **You advise; the brokerage holds the permit.** Never take custody of that obligation.

F2 · Abu Dhabi runs a different system

Severity: High for anyone advertising outside Dubai · Frequency: common misconception

Root cause. Teams assume Trakheesi covers the UAE. It does not. Abu Dhabi operates **Madhmoun**, administered by ADREC through the DARI portal, with its own verification against the property register, owner approval before a permit issues, a cap of **three brokers per listing**, and outdoor advertising rules in force from **1 January 2026**.

Impact. Campaigns extended from Dubai into Abu Dhabi go live non-compliant, and the team does not know until enforcement arrives.

Fix. Separate compliance workflows per emirate, built into the campaign launch checklist. *Confirm current ADREC requirements directly before advising — these rules changed recently and continue to evolve.*

F3 · Advert does not match the permit

Severity: Medium-High · Frequency: common

Root cause. The permit is tied to a specific property and a specific advertisement. The listing price changes, photographs are swapped, or a creative is reused for a different unit — and the live

advert no longer matches what was approved.

Impact. A technically permitted campaign is still non-compliant, with the same takedown and penalty exposure as having no permit at all.

Fix. Version control between the permit register and live creative, with re-permitting triggered by any material change.

Part 3 — Severity and Frequency Matrix

ID	Issue	Severity	Frequency	Fix effort	Sales priority
A1	Click-to-WhatsApp black hole	Critical	~90%	Medium	Lead with this
A5	No CRM → ad platform feedback	Critical	~90%	Medium	Lead with this
B1	Lead forms going nowhere	Critical	Common	Low	Fast win
B4	Speed-to-lead collapse	Critical	Very common	Low-Med	Best teardown proof
D3	No tracking on the landing page	Critical	Common	Low	Fast win
E1	CRM as a graveyard	Critical	Very common	High	Scope carefully
F1	Missing Trakheesi permit / QR	Critical	Common	Low	Visible from outside
C2	Account restriction / disablement	Critical	Episodic	Low	Prevention sells
A2	Pixel/CAPI double counting	High	Common	Low	Fast win
A3	GA4 installed but meaningless	High	Near universal	Medium	Standard scope
A4	Consent Mode v2 EEA loss	High	Common	Medium	Qualify first
B2	Phone format chaos	High	Near universal	Low	Best quick win
B3	Duplicate leads across sources	High	Universal	Medium	Standard scope
B5	WhatsApp App instead of API	High	Very common	Medium	Prerequisite for A1
C3	Creative rejections / takedowns	High	Constant	Low	Prevention sells
C5	Lead forms delivering junk	High	Very common	Low	Pairs with A5
D1	Hero image LCP failure	High	Very common	Low	Demonstrable
D2	Mobile form friction	High	Very common	Low	Clarity proof
D4	Broken funnel handoff	High	Common	Medium	Standard scope
E2	No lead stage taxonomy	High	Very common	Medium	Prerequisite for A5
E3	Data loss on agent churn	High	Structural	Medium	Pairs with RFM
A6	Attribution window too short	Medium	Universal	Low	Reporting layer
C1	Special Ad Category surprise	Med-High	Common	Low	Credibility builder
C4	Learning phase never exits	Medium	Very common	Low	Include in retainer
E4	Agency / platform lock-in	Med-High	Common	Medium	Displacement angle
F2	Abu Dhabi Madhmoun divergence	High	Common	Low	Credibility builder
F3	Advert / permit mismatch	Med-High	Common	Low	Include in QA

The four to lead with: A1, A5, B4 and F1. Each is severe, each is extremely common, and — importantly — **each can be evidenced from outside the account**, which is what makes an unsolicited teardown possible.

Part 4 — The Language Map

Clients never describe the root cause. They describe a symptom, usually wrongly attributed. Use this to translate in real time on a discovery call.

What they say	What it usually is	First thing to check
"The leads are rubbish."	A5 + C5 — no feedback loop, so the algorithm buys junk	Is any offline conversion or CRM event returning to the platform?
"Meta used to work, now it doesn't."	C4 or C3 — learning resets from takedowns or creative churn	Ad account delivery history and rejection log
"We get conversations but no sales."	A1 — CTWA attribution missing	Is <code>ctwa_clid</code> captured anywhere?
"Our conversions doubled but revenue didn't."	A2 — deduplication failure	Events Manager deduplication rate
"Analytics stopped showing European traffic."	A4 — Consent Mode v2 enforcement	CMP wired into GTM consent init?
"Our agents respond immediately."	B4 — they do not	Submit a test enquiry at 9pm
"We're paying for the same lead twice."	B3 + B2 — no dedupe key, broken phone formats	Export 200 rows, count formats
"The website converts badly."	D1, D2 or D3 — speed, form friction, or no tracking at all	PageSpeed on the <i>ad destination</i> , then Clarity
"We can't tell which channel works."	E1 + E2 — no source capture, no stages	Open the CRM, look for a populated source field
"Our ads keep getting rejected."	C3 + F1 — policy language or missing permit number	Meta Ad Library, check creatives for permit numbers
"The agency has our account."	E4 — lock-in	Ownership audit across six assets
"Facebook disabled us overnight."	C2 — payment, verification, or BM contamination	Payment method, domain verification, BM structure

Part 5 — The 45-Minute Diagnostic

Runnable from outside the account. This is the production process behind every Tier 0 teardown.

External, no access required (20 minutes)

1. Meta Ad Library — are ads live? Do property creatives carry a Trakheesi permit number? *(F1)*
2. Click a live ad. Where does it land — a real landing page, WhatsApp, or the homepage? *(D3, D4)*
3. PageSpeed Insights on the **ad destination**, mobile profile. Record LCP. *(D1)*
4. View source — count GTM containers, Meta Pixel ids, GA4 tags. Note duplicates. *(A3)*
5. Tag Assistant on the landing page. Does anything fire on form submit or WhatsApp click? *(D3)*
6. Complete the form yourself with a real number. Time the first human response. *(B1, B4)*
7. Repeat step 6 outside business hours. *(B4)*
8. Check whether the WhatsApp reply is automated, human, or absent, and whether a business profile is configured. *(B5)*
9. Load the site through an EEA IP. Is there a consent banner, and is it wired in? *(A4)*
0. Check the ad destination on a phone — form fields, country code default, submit reachability. *(D2)*

Requires access (25 minutes)

11. Events Manager — deduplication rate and Event Match Quality. *(A2)*
12. Any CAPI events originating from a server rather than the browser? *(A2, A5)*
13. Google Ads — any imported offline conversion actions? *(A5)*
14. GA4 — currency, timezone, internal traffic filter, marked conversion events. *(A3)*
15. GA4 — self-referrals in the referral report, indicating broken cross-domain. *(D4)*
16. Ads Manager — campaign geography vs Special Ad Category status. *(C1)*
17. Ad account — rejection and takedown history. *(C3)*
18. Ad set count vs monthly budget; days since last learning-phase exit. *(C4)*
19. CRM — export 200 rows: source field populated? Phone formats? Duplicate rate? *(B2, B3, E1)*
20. CRM — stage definitions, and whether "qualified" is written down anywhere. *(E2)*
21. Asset ownership — ad account, pixel, domain, CRM, WhatsApp number: who holds each? *(E4)*
22. Any campaign geography outside Dubai, and is there an ADREC workflow for it? *(F2)*

Output: three findings maximum in the teardown, ordered by money lost. Never send all twenty-two — a full list reads as a sales document, while three specific findings read as expertise.

Part 6 — Discovery Questions

Ordered so that each answer earns the right to the next. None of them sound like a sales question.

1. When a deal closes, can you trace it back to the ad that produced it?
2. What happens to a WhatsApp lead between the first message and the viewing?
3. Who owns a lead in the first ten minutes after it arrives?
4. What does your CRM call a "qualified" lead, and who decided that?
5. Does anything from the CRM go back into Meta or Google?
6. Who holds the ad account and the pixel — you, or your agency?
7. What share of your buyers are outside the GCC?
8. Who checks that a creative has its permit number before it goes live?
9. When an agent leaves, what happens to their conversations?
0. What do you currently believe your cost per *qualified* lead is — and how is it calculated?

Question 10 is the close. Almost nobody can answer it, and the silence that follows is the entire value proposition.

Data quality note. Meta and Google platform mechanics (deduplication, consent mode, Special Ad Category) are documented by the platforms themselves and are reliable. UAE permit fees, penalties and ADREC rules are drawn from secondary sources and change frequently — **verify directly with DLD or ADREC before advising a client**. Frequency percentages in this document are field judgement, not measured data, and should never be quoted to a client as research.
